

AEC Practical II

Practical I

Objective - To find a graph (evidence) to show evidence for climate change in a region of your choice and comment on its consequences.

- We can see in the region of Delhi, India that in the past few decades the weather has gotten hotter and dry (arid).
- Can you feel that in your experience in the past few years? - The past two years have been the hottest on record.
- Reasons
 - Deforestation
 - Land use change - increase use of concrete, metal and glass.
 - Increased vehicular traffic.
- Consequences
 - Human life - heat stroke
 - Economic - increased medical expenditure

- Environment - loss of biodiversity
- Way forward
 - Adopt sustainable lifestyle
 - Technology - use electric vehicles
 - Renewable energy - use solar or wind energy.

Practical II

Objective - Design a survey to understand people's qualitative response to global warming and climate change.

- What are the characteristics of a good survey
 - Simple to understand.
 - Not much time consuming - few questions
 - Direct and to the point
 - Questions should not be of personal nature.
 - Cover all the topics
 - survey must be representative meaning sample must be from all strata of society
- What questions can you ask?
 - What is your name, age and occupation - Ramesh, 50, Samosa vendor.
 - Have you heard of climate change - Yes I have on the news, I saw that our PM was headed to a climate change summit.
 - What do you think about climate change do you think you're affected - Yes, surely we all are children of this planet and affected by anything that happens on it.
 - How much do you spend on mitigating climate change - I have a small cooler at home, in the morning I put a mug of water in fridge and at night i put that in the cooler.
 - Has anyone in your family ever gotten ill because of climate change? - Yes I got heat stroke and loose motions just few months ago it was so hot, but I had to earn a living - I was admitted in the hospital for two days and it cost me a lot.
 - Do you have anywhere else to go to if situation doesn't improve - I have two teenagers, as soon as they're on their feet, I will return to my village of Lakhimpur.

- Does the heat affect your livelihood - Yes it does, who wants Samosas in this burning heat - Now after two years of less business, during winters I will sell masala peanuts but for that i have to invest in bags of peanuts, one small stove, brass kadai, and learn how to make masala.

Practical III

Objective - Develop and enact a mock session of UNFCCC to analyze how climate change negotiations work from point of view of developed and developing nations.

Divide into two groups; developed and developing nations (choose one)

	Developing	Developed
Historic burden of pollution	You have a historic burden as you went through the Industrial Revolution first thus polluted much more than us.	Yes that's true, we worked with the tech. That was available at that time, how can you blame us for technological innovation?
Slavery & colonialism	Technology is one thing but all your raw materials came from Asia, Africa & S. America but either enslavement or colonization.	Yes, that's true, we were only following the cultural norms of that time. Before this even human sacrifice was considered normal. As time changes, the cultural norms also change.
Repatriation - seeking justice and compensation for damages or injustice inflicted in the past.	Repatriation - your era of colonization & slavery was built on exploitation, the only justice now is if you paid for your past mistakes by polluting less or giving us money or technology.	The matter is not so simple or black/white. A section of your own people helped us against you. You had your own political differences that we exploited. You should ask for repatriations from your own people.
Adoption of new technology	We can adopt new technology but that would be expensive and we need to uplift as many as our people as possible in a short amt. Of time.	But your population is very large, we understand that we left you post-colonization in a very poor state but you can take loan from us to adopt new less polluting technology.
Financial assistance	Loan? - No and fall into new or neo-colonialism trap where we would need to take new loan to	There are many dual use technologies, if we transfer tech. Maybe you'll use it for military

	repay back the old loan. How about transfer of technology?	purposes. There are a lot of wars and conflicts b/w developing countries. If we give you a grant then there is a lot of corruption in your country also, how much will reach where the money is actually needed?
Final thoughts	Then what is the solution? Without financial help or transfer of tech. We cannot achieve zero pollution quickly.	Okay so as a compromise we will transfer you at least a decade old tech. And also give you assistance such as equipment and training instead of cash transfer.

- All parties agree that outcome was compromise and fruitful and will meet next year.

Practical IV

Objective - Analyze the list of sustainable development goals (SDG) and suggest three were improvement needs to be made.

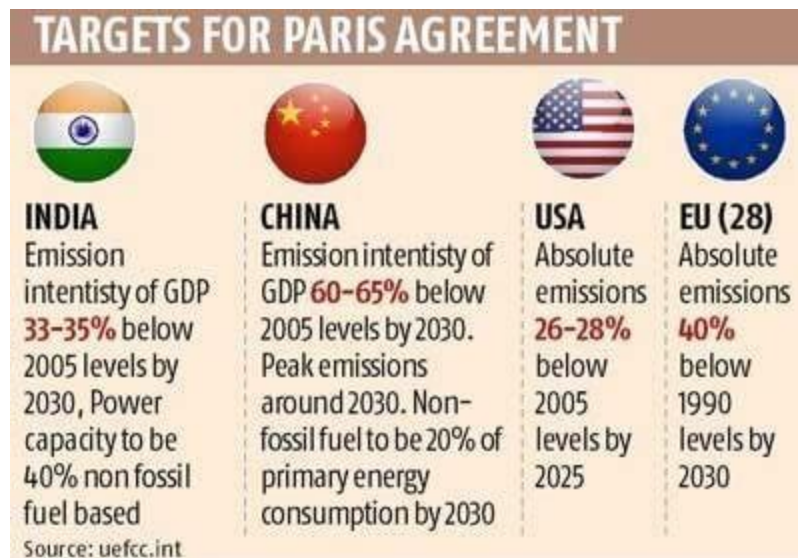

- Heat waves
- Quality education
- Urban hygiene and waterlogging

- Sanitation - cleanliness of urban areas and more public toilets also clean public water for drinking
- Urban municipal solid waste - prevent mountains of garbage accumulating
- Carbon footprint - reduction, promotion of sustainable lifestyle among youth.

Practical V

Objective - Comment on the nationally determined contributions (NDC) of various countries.

- What is an NDC? - In the Paris Accord (2015) each country was allowed to make a voluntary contribution by which they will reduce their emissions.
- Developed country - USA - the commitment is too small, given that USA is the world's biggest polluter.
- Developing country - China - one of the biggest polluters - an NDC of nearly 60-65% is too much, it is unrealistic.
- India - an NDC of about one third is very much significant and achievable. We've struck the middle ground balancing our development and climate change.
- How can you help the nation to achieve this ambitious target of reducing emissions?
 - Eat less processed and fast foods.
 - Organic gardening.
 - Use the AC and heater less often.
 - Electric scooter and solar water heaters.

Practical VI

Objective - Explore the college campus and find out any biodiversity that is useful to humans.

palm tree - asthetic looks good.

grass - prevents soil erosion and recreation (football)

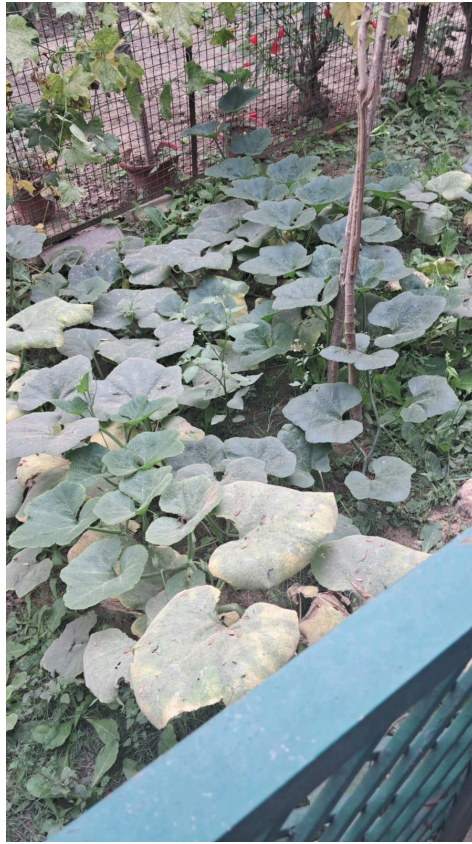

Dog - companionship and protection

Trees - sequester and remove CO₂

Neem - medicine

pumpkin - food

Banana and
